

ABSTRACT OF THE DISCLOSURE

Upon receipt of an incoming signal containing information regarding a caller's telephone number, whether a telephone number matching with the received telephone number 5 is registered in the memory part 17 is determined. A baseband part 12 converts the caller's name which corresponds to the registered telephone number into voice information if the telephone number is among the registered numbers but converts the received telephone number into 10 voice information if the telephone number is not among the registered numbers, the voice information is reported by an earphone/microphone 13, and the call is taken. If the telephone number information is not contained in the incoming signal, this fact is reported in a similar manner. 15 Further, this informing operation is omitted and the call is taken directly if the earphone microswitch 22 is depressed.
